

FW Murphy Engine Integrated Control System - EICS - has improved the performance of smaller horsepower packages worldwide. We are adapting this groundbreaking technology to the large horsepower segment.

EICS®-VHP
ENGINE INTEGRATED CONTROL SYSTEM

- New Mass Flow Air Valve & Mass Flow Gas Valve Designed for Application
- Designed & Tested Specifically for Large Engines
- Increases Uptime and Reduces Costs

We Make
BIGGER
Engines
BETTER

FW Murphy revolutionized engine management a decade ago with the introduction of **EICS**. For the next step, we've moved to larger horsepower engines to maximize our Engine Integrated Control System for the **VHP engine**.

EICS combines key components – ignition system, air/fuel control, speed governing, interface diagnostics, sensors, harnesses and catalyst – in one package saving money and man-hours in installation and setup of separate engine components.

Engineered for VHP Series Waukesha engines, **EICS-VHP** maintains emission compliance, optimizes performance and simplifies engine diagnostics. Models are currently available for the **7042GSI**, **7044GSI** and **5794GSI**. Additional models are coming soon.

The creation of the newly engineered **Mass Flow Air Valve (MFA)** and the **Mass Flow Gas Valve (MFG)** by FW Murphy maximizes performance and emission reductions. Our multi-year, multi-million dollar investment in creating this technology will keep your large engine running at its peak.

This EICS variant designed and tested for these specific engines eliminates the need for manual adjustments and reduces costs.

**Get the most out of your big engine.
